СОБИРАТЕЛЬ ОБРАЗОВ: АНТОН ЗАНЬКОВСКИЙ И ЕГО МИФОЛОГИЯ

В статье, которая является одновременно культурологической и литературно-критической, рассматривается мир и мифология произведений писателя Антона Заньковского (род. 1988). Он – человек двух городов: Санкт-Петербурга и Воронежа, автор романов "Девкалион" (2015) и "Ветoshiца" (2016), опубликованных в литературном журнале "Нева". Эти романы – прозулка местами памяти, тщетная попытка вернуться в золотой век детства и отрочества, они разрушают привычное пространство-время, пробуждая его восприятие к изначальной сингулярности, к предельности момента рождения Вселенной. Образность произведений Антона Заньковского предстает некоей непосредственной онтологией, благодаря особой чувственности и почти телесной осязаемости текста. Автор выступает коллекционером ощущений и образов, после чего, однако, остается пустота и безразличие, а память сменяется забвением. Роман-проза вдруг оказывается оборотнем-стихом: неизвестно, что точнее описывает этот мир – сам роман или стихи – ритмы-выдержки из него. Это мифология вечного движения, "топографической амнезии", фланирования, лабиринта, улиц, орнаментов, арабесок, линий, аллюзий, прошлого, детства, ностальгии, сожаления, беспокойства и мечтаний сна.

Ключевые слова: образность, "жанровое оборотничество", предельность, кинестезия, онтология образа.

IMAGERY COLLECTOR: ANTON ZAN'KOVSKIY AND HIS MYTHOLOGY

This article is both a culturological and literary-critical work. It is devoted to the world and mythology of Anton Zan'kovskiy's works. Anton Zan'kovskiy is a writer from St. Petersburg. But he was born in Voronezh in 1988. Thus, his work is the world of these two cities and walks into his memory places. It is a solo of a trot, hiking through the forest. He is the author of the novels "Deucalion" (2015) and "Ragwoman" (2016), which were published in the literary magazine "Neva". Anton Zan'kovskiy often mentions Ukrainian culture in his novels, he also uses sometimes Ukrainian language. When a reader is immersed in the world of Anton Zan'kovskiy's novels, he feels the way of Andrei Bely, Osip Mandelstam, Vladimir Nabokov, Alexander Blok, Anatoly Mariengof vision. These novels destroy the habitual space-time, bringing our perception closer to the primordial singularity, to the irreducibility of the birth moment of the Universe. It can be said, that these works are nostalgic and melancholic, this is an appeal to the golden age of youth and childhood. Anton Zan'kovskiy writes novels – prose works, but his novels are "werewolves". In fact, prose novels turn out to be poems. The world in these novel-poems is depicted as unevenness, gluing. Life is represented as rhythm, hesitation, confusion. The imagery of Anton Zan'kovskiy's works appears to be an ontology on-the-scene, thanks to the special sensuality and almost physical sensibility of the text. The author is a collector of sensations and images, after which, however, emptiness and timelessness appear, and memory is replaced by oblivion and silence. However, Anton Zan'kovskiy's works arise from a fall, from "diving for pearls" into pensive – a deep of the past, from the melancholy, from a desire to return to the past. The author wants to return to the past and to go through a phase – to feel the same emotions. It is believed that the world of these werewolf novels is born from the feelings of decadence, from the emotions of decline. That's why the reader can see despair, disappointment, and lack of surprise: the author has lost his spontaneity, and the world has ceased to be magical. This is the mythology of perpetual motion, "topographic amnesia", flanking, labyrinth, streets, ornaments, arabesques, lines, allusions, past, childhood, nostalgia, regret, anxiety and dream.

Key words: imagery, "genres-werewolves", irreducibility, kinesthetic sense, ontology of the image.

THE CULTURAL MISSION OF CLASSICAL UNIVERSITY

The article is devoted to the analysis of historical dynamics of university and its classification of cultural types. The main part of attention is concerned over the classical model of university and its transformations.

The university carries out a social institution. It has absence of its own an autonomous field of culture, which is a form of spiritual rather than social production. Education is a set of social institutions that produce the social structure directly, that is, social technology with the purpose of human and social production of the new model. The society of the late Modern becomes a collection of social institutions (not only educational, but

© Павлова О. Ю.

also legal, political, economical, and even in a certain sense cultural) and industries (specialized fields of material production). Education in this sense is a form of human production in general, while economics, politics and law are generally aimed at the indirect production of people through the logic of much complicated institutes movement: economics, politics, law (goods, power structures and laws). Depending on the national model of education, universities determine the priority of certain educational strategies.

The university as a social technology, based on the new sample of the anthropological model, forms disciplinary practices that function for production of habitus and cultural capital, and also provides identification "under the auspices of the concept of culture" (B. Readings) in the Modern era. This cultural-historical period is characterized by the fact that social control is carried out not with the help of personal coercion, but of the passage through institutions. A higher educational institution in the era of Modernity is the most consistent embodiment of the idea of a social institution as an intermediary between spiritual and material production. Culture in this context acts as a form of "high culture," that is, as a way of human existence just like this, with value orientations on the foundations of universal cult of reason. The "Cultural Mission" of the University is a mediation between the regulatory ideas of the Modern and a certain type of state that is, to be a social technology of nation-building. The technology of cultivating reason is provided by studying at the Philosophy Faculty and is an obligatory philosophical component for other faculties in the German model, created by V. Humboldt. The formation of the cult of universal reason and self-sufficient subject is the basic task of the classical university and its leading sociocultural function and cultural mission.

Keywords: university, classical model of university, cultural mission, social institute, cultural field, social technology.

Formulation of the problem. Contemporary cultural transformations make significant corrections to all present socio-cultural configurations. A university as the basic phenomenon of Modern is not standing outside of these changes. Pessimistic scenarios declare "death" and "destruction" as the most obvious prospects of its future (T. Eagleton, B. Readings). In the meantime, the most optimistic ones, on the contrary, anticipate increasing of its cultural potential in the context of "knowledge economy" development. The fact that the socio-cultural functions of a university are changing in the "post-national constellation" is supposed to be generally accepted. The above mentioned fundamental shifts require clarification and explanation of the historical dynamics of higher education institutions, the cultural mission of its classical model in particular. Since the experience of corporation that successfully survived several civilizational transformations causes respect, as well as both theoretical and practical interest.

Condition of the problem. The works, written by I. Kant, J. Fichte, Fr. Schelling, M. Weber, J. Newman are devoted to clarification of the social role of the University and its cultural mission. So far, the socio-cultural functions of higher education institutions and their historical transformation are introduced within the sight of such contemporary researchers as P. Bourdieu, O. Oexle, T. Eagleton, M. Kveik, B. Readings, L. Gubersky and others.

The task of our research is to determine the cultural mission of the University classical model.

Main part. The classical European philosophy of consciousness was based on the universality of the identity principle on the condition of immanent unity of being and thinking. The autonomy of the transcendental subject correlated with the isolation of a man from social conditions of his life and the opposition of the forms of high culture. The unity of the subject itself was carried out in the epistemological dimension on the intellect universalism basis as the necessary moment of its autonomy realization. All this was a symptom of a shift in the social self-production sphere.

In the Modern era, the production of the subject was carried out not through the personal compulsion, as in previous eras, but through opposition to the logic of the swap of things as goods and gradually shifted to the sphere of "passing through the institutes" (B. Readings). The establishment of a market economy and a national state were not independent, except the only one socio-cultural process (F. Braudel, K. Polanyi). The modern technology of social production was not just a derivative from the syncretism of material and spiritual culture, but mediated the relationship between industrial production and forms of high culture, the social division of labor, and "an organic type of solidarity" by E. Durkheim. Forms of high culture required the body of social structures, on the one hand, and, on the other hand, the industrial and economic spheres were the result of the subjects interaction as atomic individuals, which were caused by their relations with things. Industry demanded the economy specialization, legal and political systems for its successful functioning, which led to the formation

of institutions derived from the sectoral division of the industry. At the same time, another type of social activity – social technology itself – separated (that came out of the specialization of the material and spiritual spheres of production).

Firstly, it was the sphere of education. The latter serves as a technology for the person formation in a complex, differentiated society, where the reproduction of social opportunities of every one is carried out significantly outside of one's belonging to the occupations in one's family and genus in general. Education is a social lift, "social magic" (P. Bourdieu), exit beyond the three classical stratum of the Indo-Europeans (oratores, bellatores, laboratores), by G. Dumezil.

University as a form of higher education becomes the basic institute of the Modern, it is the crossing of its two main dimensions: the academic corporation and the state institution. It should be noted that the first appointment was initially self-sufficient. Moreover, all corporations were carried out as universitas, that is, as a community of equal people who had vowed each other. This was the union of any craft guild and even the city community as a whole, the prototype of any institute in the modern sense of the word, and even a legal person, as being proved by the studies of the medievalists (J. Le Goff, P. Uvarov). Gradually such a name was fixed only for a certain type of educational institutions.

We shouldn't also forget about the religious-ritual dominant of any premodern civilization. In the statutes of the first universities, in particular Parisian one in the XIII century, it was recorded that they were "a community of the alive and the dead" (O. Oexle). This meant, first of all, the responsibility for the funeral ceremonies of community members and for the funeral prayers for them. Since being detached from blood relatives, students and even lecturers usually stayed in a foreign country without support, such an important for religious people thing as funeral and memorial were provided. The rituality of the last ones was even obligatory for Christianity, despite the high degree of theology rationalization. Consequently, in pre-modern Europe, the university was born as a transnational corporation based on the principles of the civilization of Christian Europe unity and the organizational – Papal Curia. However, the first change of the Reformation, and then secularization, allowed it to be nationalized quickly.

The building of a national state required an increase in the bureaucracy and, accordingly, an educated class of people. Time has shifted accents. University autonomy, which took its origins in the codes of guilds, gradually began to serve as a necessary social distance from the utilitarian cares of life in order to create an appropriate anthropological model.

The social function of the university was explained by I. Kant in the well-known work "the Conflict of the Faculties". He said that the state as a source of financing uses the product of university education – educated people. The latter are needed "to influence the people by the certain teachings" [1]. Such an influence becomes possible due to the fact that people are lost in the contradiction between their sensual impulses, private goods and social requirements. They do not want to be responsible for every deci-

sion and want to be led in the most enjoyable and safe ways. What basically the state did through the community of not professional scientists, but educated people who represented "motivation reasons" to coordinate the interactions between individuals and, more importantly, with the state. I. Kant emphasizes that "according to reason (that is, objectively) the following order exists among the incentives that the government can use to achieve its ends (of influence the people): first comes the eternal well-being of each, then his civil well-being as a member of each society and, finally, physical well-being (a long life and health)" [1]. Each of these "incentives" had a projection of the socio-cultural system of the Modern and a psychological coloration that represents private space of the atomized individual. After all, person of Modern is connected with the social whole private interest. "Eternal well-being" is a private dimension of spiritual culture; "physical well-being" was a condition of material, even physical reproduction of an individual. "Civil well-being" - this is a form of the evolving private interest in the general legal system of society self-production. Each of these areas is a combination of disciplinary practices described by M. Foucault (first and foremost, medicine and law). The last ones were devoted to create the conscience as the "body of the prison," that was, "by teachings regarding the second (civil well-being) it (government) helps to keep their external conduct under their reins of public law" [1]. Modern disciplinary practices, their norms and rules, differ both from the types of institutionalization of the human actions in Premodern, and from the value orientations of cultural fields.

In the dimension of high culture there was a certain number of fields producing a priori values and "the system of things", which are intended to legitimize the self-sufficiency of each of them (in case of art and science). In the body of society such cultural fields incorporate by social institutions. The last ones have the middle function: to preserve the a priori status of values and to form the producers and consumers of them, that was to deal directly with the actors as their agents. For the incorporation of subjects into social structure of cultural field disciplinary technologies are being produced, which, in the process of learning and obsessing, turn into habitus (body techniques) and cultural capital (an interiorized set of knowledge and values), in the terms of P. Bourdieu. Modern body typification techniques and their legitimation in public perception as generally recognized lead to the formation of disciplinary practices. N. Elias explained their fundamental difference.

The Formation of social structures that provide the implementation of these disciplinary practices is the process of institutionalization. The emergence of a certain set of knowledge, the content of which determines the form of its implementation, also causes a certain style, a certain way of thinking. The functioning of such knowledge as a cultural capital was a form of implementation of discursive practices. They supplement disciplinary practices and even gradually begin to provide reflation over them, organize them, asking for models and norms for the last ones. The autonomy of the theoretical sphere sets authority and level of recognition of discursive practices and becomes the basis of their ideology. Thus, the role of discourse and ideology in the process of institutionalization of Modern is much higher than in previous historical types of culture. On the autonomy of the theoretical consciousness itself and the spiritual forms of culture is generally based the specificity of the social institutes of the Modern age.

The process of person incorporating into the body of a social institution is the most successful when it is not just a bad imitator (that is the difference between a simple which is produced by a cultural field and its unsuccessful bearer becomes

obvious), but when a person becomes the creator of socio-cultural norms and even the institution, that is, it promotes the autonomy of the cultural field and / or its financial success. In fact, the producing of disciplinary practices is a condition of obsessing them as a separate subject, that is, the moment of self-production of the cultural field itself in a social dimension. The dualism of habitus and cultural capital, of the cultural field and of the institute as its basic social structure is sufficiently stable in the context of the domination of a closed type of cultural field, for example art production. The university is a more pure form of a social institute than social structures of the art field. In order to clarify this problem, one should turn to the incomplete problem of the institute.

British researcher R. Williams in his work "Keywords vocabulary of culture and society" concluded, that "Institution is one of several examples of a noun of action or process which became, at a certain stage, a general and abstract noun describing something apparently objective and systematic; in fact, in the modern sense, an institution" [3, p. 168] in the dimension of human interaction.

Human activity always makes sense and obeys a certain established rule or order. This sense of installation is very important. After all, the use of the term "institute" in the English language in the 14th century had a connotation of "establish, found, appoint. In its earliest uses it had the strong sense of an act of origin - something **instituted** at a particular point in time - but by mC16 there was a developing general sense of practices established in certain ways, and this can be read in a virtually modern sense: 'in one tongue, in like manners, institutions and laws (Robinson's translation of More's *Utopia*, 1551); 'many good institutions, Laws, manners, the art of government' (Ashley, 1594). But there was still, in context, a strong sense of custom, as in the surviving sense of one of the institutions of the place" [3, p. 168]. British law still has retained the peculiarities of the case-law of its application, in contrast to universalist and rationalist shifts in its French interpretation of it, up to the requirement of the Declaration of Human Rights. In this, the emergence of a conflict between the aristocratic respecting of tradition and the democratic nature of the enlightenment critique of tradition is seen as a superstition, which is clearly demonstrated by G. Gadamer.

R. Williams notes that it is not easy "to date the emergence of a fully abstract sense; it appears linked, throughout, with the related abstraction of SOCIETY. By C18 an abstract sense is quite evident, and examples multiply in C19 and C20. At the same time, from mC18, institution and, later, institute (which had carried the same general sense as institution from C16) began to be used in the titles of specific organizations or types of organization: 'Charitable Institutions' (1764) and several titles from 1C18; Mechanics' Institutes, Royal Institute of British Architects, and comparable organizations from C18 here probably imitated from the Institute National, created in France in 1795 in consciously modern terminology. Institute has since been widely used for professional, educational and research organizations; institution for charitable and benevolent organizations. Meanwhile the general sense of a form of social organization, specific or abstract, was confirmed in mC19development of institutional and institutionalize. In C20 institution has become the normal term for any organized element of a society" [3, p. 168].

It is worth mentioning, that data of R. William's definition are rather descriptive, but they enlighten the historical dimension of the question.

The logic of making ordinary, "typicality" of human action, which comprises the functions of its objectification and legitimation, is put into the basis of the consideration of the institutionalization of human life in the works by A. Gehlen, P. Berger and T. Luckmann. Significantly higher degrees of unification and rationalization of the institutes of Modernity

are characterized by M. Weber and J. Thompson. A new form of Modern society myth (D. Meyer, B. Rowen) [2, p. 340–363] and its ceremonies in the form of self-compel and self-control (N. Elias) is also noted by researchers as a modern feature. The specificity of the institutes of the Modern consist of using disciplinary practices that, by help of the internalization of certain behavior codes, creates the new technology of social production of man. After all, the Modern institute is controlled not only by its own mechanism of implementation, and not even by additional sanctions (such as completion or punishment), but created the most productive reflexive model of self-control. The universal cult of mind and, accordingly, the Faculty of Philosophy, not only produces the new type of discourse or cultural capital, but also a way of new social formation. Thus, the new anthropological model is produced, also a new social order, where consciousness is formed as an instance which separated from the living conditions and controls it from the outside. Such a sociocultural practice would not have been possible without the experience of Christianity and its confessional procedures. Their influence could already be evident in such early Modern characters as Don Juan and Dr. Faust. However, the self-control of Christianity was sent to the authority of God, and therefore autonomy of consciousness could not be implemented consistently. Modern anthropocentrism did not foresee external instances, but itself was rooted in human sensual-rational dualism. The autonomy of theoretical consciousness was provided by disciplinary practices of university education.

The university, for example, as opposed to art, is a social institution itself, in other words it has absence of its own an autonomous field of culture, which is a form of spiritual rather than social production. Education is a set of social institutions that produce the social structure directly, that is, social technology with the purpose of human and social production of the new model. The society of the late Modern becomes a collection of social institutions (not only educational, but also legal, political, economical, and even in a certain sense cultural) and industries (specialized fields of material production). Education in this sense is a form of human production in general, while economics, politics and law are generally aimed at the indirect production of people through the logic of much complicated institutes movement: economics, politics, law (goods, power structures and laws).

Depending on the national model of education, universities determine the priority of certain educational strategies. This is generally accepted business orientation of American higher education institutions. In French universities after the Napoleonic reform, a correlation of the interests of the state with social division of labor was implemented. The priority of university autonomy, research programs and the broad humanitarian basis of studying is characterized by the Humboldt model. The more problematic was the collision of the formation of a national state, the more claims model of the university to a greater degree of social disposition. The Humboldt version became a classical form of the university and has spread into many countries around the world. In particular, Ukrainian universities were formed by its model.

Exactly this German model of the university has become an object of I. Kant's reflection. The specialization of the faculties, through which the production of this type of educated people is carried out, correlates with the modern form of socio-cultural differentiation. The discursive practices of individual disciplines and faculties become the basis for the identification of professional communities. The University, accordingly, was an institute, an intermediary form of a social system between a state machine and atomic individuals. Division, which was formed empirically, in I. Kant's opinion, nevertheless, corresponds to a certain a priori principle.

All these spheres of privatization of the public good for which the medical, legal and theological facilities are practical, service and non-self-sufficient, despite their ability to

formulate guidelines and dictate orders. They are not able to clarify their own principles, and therefore the basic one for I. Kant was the lower faculty - philosophical - the task of which was "the public presentation of truth as its function" [1]. Exactly his impracticality, the inability to formulate orders and to provide "bread training" (Fr. Schelling), enables freedom of judgment and truthfulness of knowledge of representatives of other faculties. His task is to produce educated people whose "the increased insight gained from this freedom, a better means for achieving its ends than its own absolute authority" [1] This means that the universality of reason is a Modern ground for coordinating action, in contrast to Premodern compulsion. Therefore, the resolution of the conflict of the faculties can be either "legitimate" - the recognition of the universal status of reason for the functioning of the national state, or "illegal", which provides a short "heroic way" to the disappearance of the lower faculty.

The explanation for the "Conflict of Faculties", in this regard is the concept of Canadian researcher B. Readings, which proved the connection of this university model, which is based on the idea of culture, with the structures of the functioning of the national state. Its political discourse is based on the principles of sending to a collective entity, which represents itself as a "species-being". Therefore, the basic task of the national state is the task of implementing the "rational self-determining subject of modernity", that is, a self-sufficient subject. The army (Z. Bauman), literature (B. Anderson, M. McLuhan) and education (M. Foucault, B. Readings) are the socio-cultural technologies of this complicated process. The last can represent school and university. If a school (and even the obligatory elementary education as a whole) has its task to form disciplinary practices that provide extremely important for the Modern Dominant of Consciousness the "techniques of the body," as well as the level of literacy required for the reserve army of labor and just an army (that is, first of all, caused by the charity of the "social state", a welfare state, as proved by Z. Bauman and K. Polanyi), the task of creating and reproducing a model of national identity, the bearer of which is a self-sufficient subject becomes exactly the formation of Humboldt's model of the university.

Subjected to an autocratic monarchy was, in the first place, limited (or, conversely, privileged) by rights. There is no wonder one of the first historical acts of the bourgeois revolution in France was the acceptance of the Declaration of Human Rights. The necessity of the equality of all people under the law, which is ensured by the division of power was also proclaimed by S. Montesquieu. The subjugation of the Modern subject to the national state was carried out differently from the non-Modern way. In previous times, personal coercion was a dominant form of relations between people and social systems, but gradually the rich form of dependence became the most important. In such a specific situation, the relationship between a man and the state is carried out through the passage of a number of social institutions, the crown of which is the university. "I" can become transcendental, only "passing through the people" (B. Readings), or much precisely through the nation. The University model, proposed by A. Humboldt, in contrast to the French version (Napoleonic) and the American (Hopkins) one, has not accidentally deliberately denied the orientation of "bread learning" (J. Schelling) or the state's needs, that is, the provision of a profession to be fed after the end of study, but set goal for creating a self-sufficient subject.

Conclusions. Thus, the university as a social technology, based on the new sample of the anthropological model, forms disciplinary practices that function for production of habitus and cultural capital, and also provides identification "under the auspices of the concept of culture" (B. Readings) in the Modern era. This cultural-historical period is characterized by the fact that social control is carried out not with the help of personal coercion, but of the passage through institutions. A higher educational institution in the era

of Modernity is the most consistent embodiment of the idea of a social institution as an intermediary between spiritual and material production. Culture in this context acts as a form of "high culture," that is, as a way of human existence just like this, with value orientations on the foundations of universal cult of reason. The "Cultural Mission" of the University is a mediation between the regulatory ideas of the Modern and a certain type of state that is, to be a social technology of nation-building. The technology of cultivating reason is provided by studying at the Philosophy Faculty and is an obligatory philosophical component for other faculties in the German model, created by V. Humboldt. The formation of the cult of universal reason and self-sufficient subject is the basic task of the classical university and its leading sociocultural function and cultural mission.

КУЛЬТУРНА МІСІЯ КЛАСИЧНОГО УНІВЕРСИТЕТУ

Стаття присвячена аналізу історичної динаміки університету та класифікації його культурних типів. Основна увага приділяється класичній моделі університету та її трансформаціям. Університет є соціальною технологією, яка заснована на новому зразку антропологічної моделі та дисциплінарних практиках, що являють собою виробництво габітусів в епоху Модерна. Цей культурно-історичний період характеризується тим, що соціальний контроль здійснюється не через особовий примус, а "проходженням через установи". Вищий навчальний заклад в епоху Модерну є найбільш послідовним втіленням ідеї соціального інституту як посередника між духовним та матеріальним виробництвом. Висока культура в цьому контексті здійснюється на основі універсального культу розуму. Формування культу універсального розуму та самодостатнього суб'єкта є основним завданням класичного університету та його культурної місії.

Ключові слова: університет, класична модель університету, культурна місія, соціальний інститут, культурне поле, соціальні технології.

КУЛЬТУРНАЯ МИССИЯ КЛАССИЧЕСКОГО УНИВЕРСИТЕТА

Статья посвящена анализу исторической динамики университета и классификации его культурных типов. Основное внимание уделяется классической модели университета и ее трансформациям. Университет рассматривается как социальная технология, основанная на новом образце антропологической модели и дисциплинарных практиках, которые представляют собой производство габитуса в эпоху Модерна. Этот культурно-исторический период характеризуется тем, что социальный контроль осуществляется не через личное принуждение, а "прохождением через институты". Высшее учебное заведение в эпоху Модерна является наиболее последовательным воплощением идеи социального института как посредника между духовным и материальным производством. Высокая культура в этом контексте осуществляется на основе универсального культа разума. Формирование культа универсального разума и самодостаточного субъекта является основной задачей классического университета и его культурной миссией.

Ключевые слова: университет, классическая модель университета, культурная миссия, социальный институт, культурное поле, социальные технологии.

КУЛЬТУРОЛОГІЧНА ЕКСПЕРТИЗА КУЛЬТУРНИХ РЕСУРСІВ

Стаття присвячена дослідженню зростаючої ролі експертного знання в процесі трансформації культури і соціальних відносин у сучасних умовах. Підкреслюється значимість і особливості культурологічної експертизи соціальних проблем, яка виступає як універсальна експертиза в проектній діяльності. В умовах переходу від індустріальної до постіндустріальної економіки культурологічна експертиза стає інструментом запровадження креативної економіки. Зокрема, мова йде про використання культурних ресурсів міст і регіонів України у створенні іміджу для залучення інвестицій та визначення спрямованості перспективного розвитку.

Ключові слова: культурний проект, культурологічна експертиза, культурна політика, експертна оцінка, креативна економіка, культурні ресурси, урбаністична політика.

Постановка проблеми. Сучасний стан соціокультурних трансформацій в Україні породжує в якості важливого інструментарію задля принципових змін потребу в експертизі, аналізі та оцінці тих або інших об'єктів соціокультурної реальності, які позначають особливості її функціонування та можливі (проектні) моделі трансформації і перспективні напрямки розвитку.

Знаменним є те, що потреба в експертизі є логічним результатом наукової революції, яка не тільки визначила напрям науково-технічного прогресу модерної цивілізації, а й принципово змінила статус знання щодо соціальних і культурних реалій, що дозволили суспільству перейти від створення "утопій" як образу бажаного майбутнього, його критики як

"антиутопій", та сформувати наукове підґрунтя проєктної та експертної діяльності в галузі гуманітарних та суспільних наук.

Аналіз досліджень і публікацій. Останні дослідження та публікації щодо збільшення ролі експертного знання в процесах модернізації культури пов'язані з поглибленням диференціації та спеціалізації різноманітних соціальних інститутів. Саме така постановка проблеми присутня в працях П. Бергера, Г. Іванова, Т. Лукмана, Ч. Лендрі, Н. Ніконової, Л. Нікіфорові, А. Скотта та ін.

Метою статті є аналіз ролі культурологічного знання й культурологічної експертизи в оцінці культурних ресурсів у процесі проектування та розвитку сучасної креативної економіки.
